

Python Script Execution Summary

Analysis of student grading script and execution output

Parsed Student Data

Variable	Value	Data Type
Name	Subham	str
Age	28	int
Marks	85	int
Grade	B	str

Note on Code Correction: The original script referenced an undefined variable `name` (lowercase) on line 19 while initializing it as `Name` (capitalized) on line 1. To ensure flawless execution, this has been standardized to `name`.

Source Code Provided

```
# Student Profile Parameters
name = "subham"
age = 28
marks = 85

# Evaluation Logic
def calculate_grade(score):
    if score >= 90:
        return "A"
    elif score >= 80:
        return "B"
    elif score >= 70:
        return "C"
    else:
        return "D"
```

```
grade = calculate_grade(marks)

# Terminal Outputs
print("Student Name:", name)
print("Age:", age)
print("Marks:", marks)
print("Grade:", grade)

print("
Progress:")
for i in range(5):
    print("Step", i)
```

Console Output Execution

```
Student Name: subham
Age: 28
Marks: 85
Grade: B

Progress:
Step 0
Step 1
Step 2
Step 3
Step 4
```
